

AI CRM Lead Automation System

A practical automation workflow for capturing, scoring, routing, and following up with inbound leads.

Type	Portfolio demo
Role	AI Automation Developer
Stack	Python, API workflow, JSON CRM, CSV export

Problem

- Small businesses receive leads across inboxes, forms, chat widgets, referrals, and ads.
- Manual copying into spreadsheets or CRMs causes slow follow-up and missed opportunities.
- Teams often cannot quickly see which inquiries are urgent or high-value.

Solution

- Built a local demo CRM automation that accepts inbound lead messages and turns them into structured records.
- The system extracts contact details, detects service needs, scores lead priority, suggests follow-up actions, and stores the result.
- A browser dashboard shows lead metrics, pipeline rows, AI summaries, follow-up dates, and CSV export.

Business Value

- Faster response to urgent leads.
- Less manual admin work for small teams.
- Clearer pipeline visibility and follow-up discipline.
- Reusable architecture for Gmail, forms, Airtable, Google Sheets, HubSpot, Pipedrive, GoHighLevel, Zapier, Make, or n8n.
