

Technical Summary

A verification-friendly overview of the AI CRM Lead Automation portfolio project.

Type	Portfolio demo
Role	AI Automation Developer
Stack	Python, API workflow, JSON CRM, CSV export

Architecture

- Python standard-library HTTP server exposes a dashboard and API endpoints.
- Lead analysis layer returns structured fields for service type, urgency, budget signal, intent, priority, next action, and suggested reply.
- JSON-backed storage keeps leads and automation logs for a zero-dependency demo.
- CSV export provides a handoff path to Google Sheets, Airtable, or CRM imports.

Endpoints

- GET / shows the CRM dashboard.
- GET /api/health confirms the service is running.
- GET /api/leads returns leads and pipeline metrics as JSON.
- POST /api/intake accepts a source and message, then creates a structured lead.
- GET /export/leads.csv downloads CRM records as CSV.

Verification

- Run `python3 src/seed_demo.py` to load 6 demo leads.
- Run `python3 src/test_workflow.py` to verify analysis, contact extraction, storage, and metrics.
- Run `python3 src/app.py` and open `http://127.0.0.1:8080`.
- If port 8080 is busy, run `PORT=8090 python3 src/app.py` and open `http://127.0.0.1:8090`.
- Submit a new lead from the dashboard and confirm it appears in the pipeline.
